Course Information

This diploma course covers the main themes in robotics, starting with the basics such as its origins. After this, kinematics and the Diffie-Hellman (DH) algorithm are unravelled, along with important differential relations. Although its roots go back to the fourteen or fifteen century, robotics is a relatively new science, engineering discipline or industrial technology that is often misrepresented in the popular media. You will learn that the history of modern robotics can be traced back to 1495 when Leonardo da Vinci designed a mechanical device that looked like an armoured knight. Later, Czech playwright Karel Capek introduced the word 'robot' from the Czech word, 'robota', meaning 'tedious labour'. Then move onto to study the basic laws that regulate robotics, such the Zeroth law, which says that a robot may not injure humanity or, through inaction, allow humanity to come to harm. Industrial robots (manipulators), fields and service robots (humanoids, medical robots and walking robots), and entertainment and educational robots are the three main categories that you will explore next.

A robot's joints and links will then be discussed in the course material. Learn how joints provide relative motion while links are rigid members between joints. There are various joint types, such as linear and rotary, and each joint provides a 'degree of freedom'. You will see how many degrees of freedom most robots possess. Robot architecture is the combination and disposition of the different kinds of joints that configure the robot's kinematical chain. As you progress through the course, you will be taught that the relative position and orientation of the axes of two successive joints can be specified by two link parameters, link length and link twist angle. You will also learn that you can represent the orientation in joint co-ordinates by the YPR (yaw, pitch and roll) convention. In rectangular or Cartesian co-ordinates, the same can be represented by a rotation matrix R , where the three columns of R correspond to the normal, sliding and approach vectors respectively. You will discover that in order to manipulate objects, it is required to control both the position and orientation of the tool/end effector in a three-dimensional space.

Finally, you will study robot path planning: such a problem is formulated in a tool configuration space, and robot motion is controlled at the joint space. You will discover that one of the potential problems with solving for joint space velocity is the non-existence of inverse, and the Jacobian matrix may not be invertible for all the values. Find out at which points in joint space, Jacobian loses its rank and why there is a reduction in the number of independent rows and columns. As part of analysing the Jacobian matrix, you will study joint spaces singularities and learn that the interior singularity is potentially troublesome, as it is formed when two or more axes form a straight line. This course will be of great interest to industrialists who might use robots in their factories or who are investigating automation. Students of mechanical engineering, especially those specializing in robotics, will also find this course particularly interesting.

Modules Studied

Module 1: Fundamentals of Robotics

Module 2: Robotics and Kinematics

Module 3: First Assessment

Module 4: DH Algorithm

Module 5: Kinematics

Module 6: Differential Relations

Module 7: Second Assessment

Module 8: Course assessment

CERTIFICATE

OF PARTICIPATION

This is to certify that

Daramola Oluwafemi Michael

PARTICIPATED IN THE

CV Projects Expo 2024

demonstrating commitment to advancing the field of computer vision through innovative project contribution.

27th November, 2024.

Mr. Daramola Oluwafemi Michael,

COMMENDATION LETTER

On behalf of the entire TECH-PIC team, I am writing to express our heartfelt gratitude and appreciation for the unwavering support and guidance provided during our More Than Certificate 4.0, 2024 Edition.

Your commitment brought a unique perspective to the programme and your dedication to the participants' growth was evident throughout. Your influence has been a testament to the power of collaboration.

The impact of your support extends beyond the programme itself, as it has empowered our participants with the knowledge, skills and confidence necessary to excel in their future endeavors.

Please accept our sincerest appreciation for your time, expertise and enthusiasm. We are honored to have had the opportunity to work alongside with you and look forward to future collaborations.

Warm regards.

Engr. Prof. O. O. Olubanjo frhd, fdec, fipmd

Director,
Technology Park and Incubation Centre (TECH-PIC)
